Problems with nested conditionals

Posted by Johannes Beigel (Guest) on 13.10.2006 09:45

I have a problem with nested conditionals in my lighty config. The following works:

```
$HTTP["url"] !~ "^(resources/|static/|favicon.ico)" {
    scgi.server = (
        [...]
    )
}
```

I.e. for every URL path not starting with of the given paths the request is passed to the SCGI server. But in the process to introduce different host names which should be handled by different SCGI servers, I started by adding nested conditional like this:

```
$HTTP["url"] !~ "^(resources/|static/|favicon.ico)" {
    $HTTP["host"] = "^myhost.com" {
        scgi.server = (
            [...]
        )
    }
}
```

(In a second step I would add an "else" clause to the inner conditional for the other host name.) But this doesn't work: Now *every* request is passed to the SCGI server with the result, that static files are not delivered. Seems like the outer conditional isn't respected at all.

What am I doing wrong?

```
# lighttpd -v
lighttpd-1.4.11 (ssl) - a light and fast webserver
Build-Date: Jun 14 2006 17:11:11
```

TIA and regards,
Johannes

Sorry:

>   $HTTP["host"] = "^myhost.com" {
```

This should read "=~" not "=" (This was a copy&paste&edit error of mine, so that's not causing the problem described above).

Regards, Johannes.

There's a ticket with a similar problem:

<http://trac.lighttpd.net/trac/ticket/41> with a similar problem

(URL and host conditional nested the other way round). But this bug was fixed a long time ago.

Anyway, I just updated my lighttpd version to 1.4.13 but it didn't make any difference. :-/

Doesn't work for me either, but I'm still thrilled getting WebDAV to work under OSX (don't know what's going on with XP). Having this fixed would be seriously cool.

OK, since you can confirm this, I've reopened the ticket:

<http://trac.lighttpd.net/trac/ticket/41>
